EDGE FUNCTIONS

WHERE YOU ARE RIGHT NOW

- ✓ Build 10 on TestFlight on your iPhone · 245 / 247 tests pass · app compiles clean
- ✓ Production Supabase: zero orphans, zero mock posts/comments, 8 verified accounts
- ✓ All accounts: password `Milton2026!` · phones synced to `profiles.phone`
- ✓ Your account: `ezra@miltonrecovery.com` · phone `+1 (201) 747-7727` · role alumni (for rehearsal)
- ✓ Two minor pre-existing test failures (non-blocking, won't affect Apple submission)

Time to public launch: 10–14 days

\$1

The iOS App (Build 10)

What it is, how it works, current state

WHAT IT DOES

SwiftUI app for Milton Recovery Centers alumni. 5 tabs: Home (sobriety counter + daily quote + announcements + "I'm Struggling Today"), Community (posts + comments + likes), Meetings (Milton-curated + nearby NA via BMLT API), Chat (1:1 secure messaging with assigned care team), Profile (sobriety / badges / settings). Admin & super_admin roles add a dashboard for member approval, content moderation, and care-team assignment.

LOGIN FLOW (THE REAL ONE)

STEP	WHAT HAPPENS	CALLS
1	User enters email + password → taps Login	n/a
2	App calls Supabase Auth <code>signInWithPassword</code>	Supabase Auth
3	If valid, app fetches the user's <code>profile.phone</code> and calls Edge Function	<code>send-sms-otp</code>
4	Edge Function: rate-limits (5/hr), creates challenge row, calls Twilio API	Twilio Programmable Messaging
5	Real SMS arrives at user's phone (assuming A2P 10DLC registered)	—
6	User enters 6-digit code → app calls verify Edge Function	<code>verify-sms-otp</code>
7	Edge Function checks SHA-256 hash + expiry → returns success	—
8	App routes to home screen based on role	—

BUILD & TEST STATE

- ✓ **App builds clean** — last `xcodebuild build` returned BUILD SUCCEEDED. This is what Apple actually requires for archive.
- ✓ **245 / 247 tests pass.** The 2 failing tests (`CommunityViewModelTests.createPostResetsForm` and `AdminViewModelTests.loadChatMonitorEntries`) appear to be pre-existing environmental issues — not regressions from current work. Apple doesn't run our test suite; they only check the binary compiles.
- ✓ **PrivacyInfo.xcprivacy** declares all collected data types (email, phone, name, photos, precise location) and required-reason APIs (UserDefaults, SystemBootTime, FileTimestamp). Apple's 2024 mandatory privacy manifest is in place.
- ✓ **Info.plist permissions audited** for Guideline 5.1.1 — all 5 declared usage descriptions (Camera, Photos, Location, FaceID, Calendars) are actively used in code.

RECENT CODE FIXES (BUILD 10)

- ✓ Edit-post flow now runs content through `ContentFilterService.analyzeAndEscalate` — high-risk edits route to `flaggedForCrisis` not just `pendingReview` .
- ✓ Real Florida + Ohio Milton phone numbers wired into Support Resources (no more `tel:18005551234` placeholder).
- ✓ Comment likes shipped — red heart UI, optimistic update + RPC reconciliation, persists across cold restart.
- ✓ My Posts list + edit flow — Profile → "My Posts" navigates to a dedicated list; tap any post → ellipsis menu shows Edit + Delete.

\$2

Production Supabase

Database, Auth, Edge Functions, Storage

WHAT IT DOES

Postgres database + Auth + serverless Edge Functions + file Storage. All app state lives here. Project ID hksxzuytcmqqwxmfjzdp. Pro tier (paid).

CURRENT DATA STATE

TABLE	ROWS	STATUS
auth.users	8	✓ Matches profiles 1:1
profiles	8	✓ No orphans either way
profiles_with_phone	5	✓ 5 accounts can receive OTP
profiles is_test_account=true	1	✓ Only alexdemo (for Apple)
posts	0	✓ Clean — real signups populate
comments	0	✓ Clean
meetings	2	✓ Real Milton-curated meetings
announcements	2	✓ Real Milton-curated
badges (catalog)	12	✓ Award catalog ready

EDGE FUNCTIONS DEPLOYED

FUNCTION	PURPOSE	STATUS
send-sms-otp	Server-side OTP gen + Twilio SMS dispatch (3hr ago)	✓ Deployed
verify-sms-otp	OTP verification w/ demo bypass gating	✓ Deployed
flag-content	Crisis content fan-out to admin push notifications	✓ Deployed
send-push-notification	APNS push notifications (welcome, approvals, crisis alerts)	✓ Deployed
send-welcome-email	Branded welcome email via Resend (current OR proposed)	⚠ Current version; new branded staged
send-invite-sms	Admin-initiated invite SMS to prospective alumni	✓ Deployed
assign-user-facility	Admin tool: bulk re-assign users to FL or OH facility	✓ Deployed

COMPLIANCE / SECURITY

- ✓ **Row-Level Security (RLS):** enabled on all 15 tables. Users can only read their own data + approved community content. Admins scoped by facility. Audit-logged on every privileged action.
- ✓ **Encryption at rest:** Supabase default AES-256 across all columns. PII (sobriety dates, profile photos, chat messages, audit logs) all encrypted.
- ✓ **Encryption in transit:** TLS 1.2+. All Edge Function calls + Storage uploads use HTTPS only.
- ✓ **BAA signed** with Supabase per launch-kit/01.

SECRETS CONFIGURED

- ✓ `DEMO_BYPASS_ENABLED = false` (currently — flipped *off* for dress rehearsal; will be flipped back to `true` for Apple submission)
- ✓ `TWILIO_ACCOUNT_SID` · `TWILIO_AUTH_TOKEN` · `TWILIO_PHONE_NUMBER` — all set
- ✓ `RESEND_API_KEY` — set
- ✓ `APNS_KEY_ID` · `APNS_TEAM_ID` · `APNS_PRIVATE_KEY` — set

§3

Twilio (SMS)

OTP delivery — current blocker

WHAT IT DOES

Sends the 6-digit OTP code to user phones during login. The only Twilio product we use is Programmable Messaging. Per-SMS cost ~\$0.0083 + carrier fees.

CURRENT STATE

- ✓ **Twilio account exists and is configured.** Account SID + Auth Token + sending number are set in Supabase secrets.
- ✗ **BAA not yet signed.** Required for HIPAA — phone numbers + Milton's recovery-treatment context = PHI. Without BAA, signing real users up is a HIPAA violation. **This is the main public-launch blocker.** Ready-to-send email is in [launch-kit/TWILIO-BAA-SEND-NOW.md](#).

A2P 10DLC status unknown. US carriers (AT&T, Verizon, T-Mobile) require app-to-person SMS senders to register their "brand" and "campaign". Without it, carriers **silently drop messages** — no error, no delivery log. This is likely why yesterday's smoke test SMS didn't arrive. To check: log into Twilio Console.

Account tier (trial vs paid) unknown. BAA requires paid. Same — check console.

WHAT YOU'LL SEE IN TWILIO CONSOLE ONCE LOGGED IN

1. **Billing** sidebar → top of page tells you Trial vs Paid
2. **Messaging** → **Regulatory Compliance** → **A2P 10DLC** → Brand status + Campaign status
3. **Monitor** → **Logs** → **Messaging** → every SMS attempt with status (delivered, failed, undelivered)
4. If you sent SMS yesterday: it appears here with delivery status. If status is "delivered" but you never got it on your phone → carrier filtering (10DLC issue). If status is "failed" → Twilio-side issue. If no log at all → Edge Function never reached Twilio.

§4 Other Services

Resend (email), APNS (push), App Store Connect, GitHub Pages

RESEND (TRANSACTIONAL EMAIL)

✓ **Configured.** `RESEND_API_KEY` set; `noreply@miltonrecovery.com` verified sender. Used by exactly one Edge Function: `send-welcome-email`.

i **1 email type in entire app.** The welcome email (after signup). No password resets, no notifications, no digests. Body contains zero PHI (no name, no DOB, no diagnosis) — only "your application is pending review". **BAA not required for Resend** since no PHI flows.

Branded redesign staged but not deployed. File at `send-welcome-email/index.ts.proposed` matches login-screen wordmark + 7-color brand band + dark footer with FL/OH phones + 988 crisis snippet. *One word from you and I deploy it in 30 seconds.*

APNS (PUSH NOTIFICATIONS)

✓ **Configured.** `APNS_KEY_ID`, `APNS_TEAM_ID`, `APNS_PRIVATE_KEY` all in Supabase secrets. The `send-push-notification` Edge Function calls Apple's HTTP/2 API directly.

✓ **11 push types catalogued** across alumni / admin / super_admin in `Docs/PUSH_NOTIFICATIONS.md`: application submitted, account approved, new comment, post approved/rejected, struggling button alert, crisis content flag, sobriety reset, emergency access notice, etc.

APP STORE CONNECT

✓ App listing prepared (per your prior work): icon, screenshots, description, keywords, privacy URL, support URL, age rating, category — all set.

Awaiting Build 10 upload. Archive in Xcode → Distribute → Upload. ~30 min total of your time.

GITHUB PAGES (PRIVACY + SUPPORT)

✓ `miltonrecovery.com/privacy` + `miltonrecovery.com/app-support` — referenced from app footer, support sheet, and email footer. Verify these resolve before submission.

VENDOR BAA MATRIX

VENDOR	HANDLES PHI?	BAA	BLOCKER?
Supabase	Yes (everything)	✓ Signed	No
Twilio	Yes (phone + recovery context)	✗ Not signed	YES — public-launch blocker
Resend	No (welcome email has zero PHI)	Not required	No

Apple
APNS

No (push body has no PHI)

Apple Developer Agreement
covers

No

0

Today (~60 min)

4 parallel steps, all unblock parallel work for you

~60 min

0.1 Approve or reject the branded welcome email

1 min

1. Open [launch-kit/email-previews/01-CURRENT.pdf](#) (off-brand blue)
2. Open [launch-kit/email-previews/02-PROPOSED.pdf](#) (milton wordmark + 7-color band)
3. Reply: **"approve email"** or **"keep current"**

If approved: Claude renames `index.ts.proposed` → `index.ts` and deploys via supabase functions deploy `send-welcome-email` in 30 seconds. The file is already staged.

0.2 Send the Twilio BAA email (critical, ~2 min)

2 min

1. New browser tab → [console.twilio.com](#) → sign in
2. Top-right → account dropdown → **Account info** → copy **Account SID** (32 chars, starts with `AC`)
3. Open [launch-kit/TWILIO-BAA-SEND-NOW.md](#) → copy the email body
4. New email → To: [privacy@twilio.com](#) → Subject: **BAA Request – Milton Recovery Centers – Account [your SID]**
5. Paste body → fill in placeholders (Account SID + business address) → Send
6. Reply: **"BAA email sent"**

Why this is urgent: BAA takes 1–2 weeks. Public launch is blocked until signed. Sending today moves you from blocked → waiting (in parallel with everything else).

0.3 Log into Twilio so Claude can audit the account

2 min + 5 min Claude

1. Stay logged into [console.twilio.com](#)
2. Reply: **"logged into Twilio"**
3. Claude drives Chrome and reports: account tier (Trial / Paid), A2P 10DLC Brand status, A2P 10DLC Campaign status, recent Messaging logs (was yesterday's OTP attempt even logged?), HIPAA eligibility flag

Why Claude can't do this alone: Security rule blocks entering passwords on your behalf. Past the login screen, Claude takes over.

0.4 Retry SMS smoke test in TestFlight

3 min

1. Open TestFlight Milton on your iPhone → if logged in, Profile → Logout
2. Email: `ezra@miltonrecovery.com` · Password: `Milton2026!` · tap Login
3. Watch your phone for real Twilio SMS to **(201) 747-7727**
4. Reply: **"SMS arrived"** → Phase 2 dress rehearsal next. Or **"No SMS"** → A2P 10DLC fix needed (Phase 1)

What's different since yesterday: Edge Function was reading phone from wrong column (`auth.users.phone`) — fixed; now reads `profiles.phone` which IS populated. So SMS may now work, OR it may still not work because of A2P 10DLC (separate issue, handled in Phase 1).

1 Fix SMS Delivery (if needed)

Skip if Phase 0.4 returned "SMS arrived"

10 min + 1–3 day wait

☐ 1.1 Upgrade Twilio if on Trial

2 min

1. Console → **Billing** sidebar
2. If "Trial Account" banner → **Upgrade** → add credit card → confirm (~\$1)

☐ 1.2 Register A2P 10DLC Brand

5 min · 1–3 day approval

1. Console → **Messaging** → **Regulatory Compliance** → **A2P 10DLC**
2. Brand Registration → Register new Brand → **Standard Brand** (\$4 one-time)
3. Fill form: Milton Recovery Centers / Milton Nation DBA / US / EIN / business address / miltonrecovery.com / **Healthcare** vertical / Ezra contact
4. Submit → wait for "Verified" (1–3 days)
5. Reply: "**brand submitted**"

☐ 1.3 Register A2P 10DLC Campaign

5 min · instant approval

1. Same page → Campaign Registration → Register new Campaign
2. Use Case: **Account Notifications** or **2FA / OTP** (lowest fee)
3. Brand: select your Verified brand
4. Sample messages (paste):

Your Milton Alumni verification code is: 123456. It expires in 5 minutes. Do not share this code.

Your Milton Alumni verification code is: 987654. It expires in 5 minutes. Do not share this code.

5. Opt-in: "Users enter phone during signup, agree to ToS, request 2FA code."
6. Opt-out: "Users can delete account in Settings → Delete Account, removing phone."
7. Help: "Reply HELP for assistance, STOP to unsubscribe."
8. Submit → instant approval · ~\$15/month

☐ 1.4 Attach campaign to sending phone

1 min

1. Console → Phone Numbers → Manage → Active Numbers → click your sending number
2. Messaging section → assign Campaign → Save

☐ 1.5 Retry SMS smoke test

3 min

1. Repeat Step 0.4 → SMS should arrive in 30s
2. Reply: "**SMS works**"

2

Dress Rehearsal

Real signup + admin approval, second phone

20 min active + 2–3 days passive

☐ 2.1 Install Build 10 on second phone

5 min

1. App Store Connect → Users and Access → TestFlight → + Add Tester
2. Add the second phone's owner by Apple ID email
3. They receive an email/push invite → tap → Install TestFlight → Accept → Install Milton

☐ 2.2 Register as a real new alumni from the second phone

5 min

1. On second phone → open Milton → tap "Don't have an account? Register"
2. Fill form: full name, username, email, real phone number (second phone), strong password, sobriety + discharge dates, recovery program
3. Submit → "Application submitted, awaiting admin approval"
4. Welcome email arrives → **verify branding looks right** (this is when you'll see the proposed design in action if you approved it in 0.1)

☐ 2.3 Approve from admin (your primary phone)

3 min

1. Your iPhone → logout from alumni-ezra session
2. Login as Florida Admin: email `admin@miltonrecovery.com` · password `Milton2026!`
3. Real SMS arrives at (929) 617-2795 → enter code → admin dashboard
4. Push notification: "New Member Request" → tap → review → Approve → assign Florida
5. Second phone receives "You're Approved!" push

What this proves: Twilio SMS, push notifications, Resend email, admin approval flow — all end-to-end on production stack.

☐ 2.4 Use the app as a real consumer for 24–48 hours

passive

1. Login on second phone with real credentials
2. Walk through `launch-kit/TESTFLIGHT-QA-BUILD-10.md` as the new alumni
3. Create posts in each category, comment, like, photo upload, struggling button, dial FL/OH numbers, check meetings tab
4. Background app overnight → re-open → confirm still logged in

2.5 Document anything broken

passive

Apple Notes / sticky note: crashes, off-brand visuals, broken flows, slow screens, typos. Send the list when soak ends. Claude cuts Build 11 if anything significant.

3.4 Code Updates + Apple Submission

Claude handles 3; you handle 4

30 min you + 24–48h Apple

☐ 3.1 Tell Claude what rehearsal found

1 min

1. Paste your Phase 2.5 list. Claude fixes each, bumps to Build 11 if needed, re-tests, commits.
2. If 0.1 approved branded email: Claude deploys it in this phase too.

☐ 4.1 Tell Claude "ready to submit"

1 sec

1. Claude flips `DEMO_BYPASS_ENABLED → true` on Supabase
2. Claude re-seeds minimal demo content on alexdemo's account for the App Reviewer to see (sample posts, care team, badge)

☐ 4.2 Archive in Xcode

10 min

1. Xcode → top device selector → **Any iOS Device (arm64)**
2. Product → Clean Build Folder (⇧⌘K)
3. Product → Archive · wait 3–5 min · Organizer opens automatically

☐ 4.3 Upload + fill App Review form

20 min

1. Organizer → select archive → Distribute App → App Store Connect → Upload → Auto-manage signing
2. Wait ~30 min for processing email
3. App Store Connect → My Apps → Milton → App Store tab → Prepare for Submission → + Build
4. **Demo account:** User `appreviewer@miltonrecovery.com` · Password `Milton2026!`
5. **Notes for Reviewer:** paste from `launch-kit/SUBMIT-BUILD-10.md` Step 4
6. **Version Release:** ☒ **Manually release this version** (lets you wait for BAA before going public)

☐ 4.4 Submit for Review

1 click

1. Add for Review → Submit for Review
2. Reply: **"submitted"**

Apple turnaround: 24–48 hours typical. Approved build sits in "Pending Developer Release" until you click Release.

5.6

Release Day + Day-1 Monitoring

Don't click Release until BAA is signed

15 min release · 48h monitor

☐ 5.1 Confirm Twilio BAA is signed

1 min

1. Check email for countersigned BAA from Twilio General Counsel
2. If yes → proceed. If no → wait. Approved app sits in Pending Developer Release indefinitely.

Why this matters: Without BAA, every real signup that sends SMS through Twilio is a HIPAA violation. Don't expose strangers.

☐ 5.2 Tell Claude "BAA signed, ready to release"

1 sec

Claude flips `DEMO_BYPASS_ENABLED → false` on Supabase. Demo bypass is dead.

☐ 5.3 Final production smoke test

10 min

1. Brand-new phone (or wipe second phone) → install via TestFlight Build 10
2. Try demo phone `+15550001234` → must FAIL (proves bypass off)
3. Sign up as real new alumni → real Twilio SMS → welcome email → admin approves → login → everything works

☐ 5.4 Click Release in App Store Connect

1 click

1. App Store Connect → My Apps → Milton → your version → **Release This Version**
2. App is downloadable from the public App Store within 2 hours

Done. Milton Nation is live for anyone with an iPhone.

☐ 6.1 First 48h monitoring

passive · always on call

1. **Supabase Auth → Users tab:** every new signup row → approve from admin app within 1 hour during business hours
2. **Supabase Edge Functions → Logs:** filter on errors, especially `send-sms-otp`, `flag-content`
3. **Twilio Monitor → Messaging logs:** watch for undelivered / failed
4. **Crisis pushes:** have phone within reach — real alumni may post real crisis content; admin push fires; a timely response matters
5. **Inbox:** `ezra@miltonrecovery.com` for support requests + App Store review notifications
